

APPARATUS AND METHOD FOR PRODUCING A DVD CARRIER ASSEMBLY

Abstract

An apparatus and method are provided for producing an assembly comprising a plurality of digital data storage media carriers attached to a carrier strip. In the production of the assemblies, carriers are positioned for movement in a longitudinal direction of the conveyor system with the carriers being in a row. Carrier strips are secured to the carriers with the longitudinal axis of the assembly and the carrier strips being generally parallel to the direction of movement of the conveyor system. Carriers are deposited onto the conveyor system via a bottom feed depositor which depositor utilizes a pressure differential to help produce positive movement of carriers from a carrier magazine onto the conveyor.
